Center of public health is not as popular as hospital nowadays in Indonesia and is affected by how people see the center of public health. The aim of this study is to measure the attitude of the center of public health and some characteristics that might have correlation with it. The participants of the research are head of family live in Cimareme, North Bandung, West Java. The result shows that the attitude of the center of public health has positive correlation with perception of the cost spent for health service, and negative correlation with perception of the cleanliness of the place and the age of the participants. Another finding shows the differences of attitude of the center of public health and perception about the cleanliness of the place based on educational background. Participant with higher educational background and younger age has more positive attitude.
